 “SECURITY OUTAGE PROBABILITY FAIRNESS FOR INTELLIGENT REFLECTING  
 SURFACE-ASSISTED UPLINK CHANNEL: ALTERNATING OPTIMIZATION VS.  
 LEARNING”

Dear Reader:

A reviewer suggested replacing the SDR algorithm with an alternative method based on the smoothing technique and FISTA algorithm. Based on the literature provided by the reviewer, we have designed the corresponding algorithm as follows.

=====

Here, we provide a detailed design based on the smoothing technique and FISTA algorithm you suggested. The smoothing technique in [R1] is an effective method for smoothing non-smooth functions. We use it to transform P2 into PR1 as follows,

$$\text{P2: } \min_{\Phi, \mathbf{W}} \max_k -z_k, \quad (1a)$$

$$\text{s.t. } |\exp(j\theta_n)|^2 = 1, \quad n = 1, \dots, N_s, \quad (1b)$$

$$\mathbf{w}_k^H \mathbf{w}_k = 1, \quad k = 1, \dots, K. \quad (1c)$$

The log-sum-exp function is utilized to smooth the non-smoothed objective function  $f(\Phi, \mathbf{W}) \triangleq \max_k -z_k$  in P2 as follows,

$$f(\Phi, \mathbf{W}) \approx f(\Phi, \mathbf{W}, \beta) = \frac{1}{\beta} \log \left( \sum_{k=1}^K e^{-\beta z_k} \right), \quad (2)$$

where  $\beta > 0$  is the smoothness parameter. According to Eq. (2), P2 can be transformed as follows,

$$\text{PR1: } \min_{\Phi, \mathbf{W}} f(\Phi, \mathbf{W}, \beta), \quad (3a)$$

$$\text{s.t. Eqs. (1b) and (1c).} \quad (3b)$$

As suggested by the reviewers, we attempted to solve PR1 by using FISTA [R2]. FISTA is a gradient descent algorithm, and we applied it to solve PR1, as shown in Algorithm 1.

---

**Algorithm 1:** FISTA Algorithm for PR1

---

```

1 Initialize  $\Phi_0, \mathbf{W}_0, t = 0$ ;
2 while  $t < \text{Iter}_{\max}$  do
3    $\Phi_{t+1} \leftarrow \text{Proj}_{\Phi}(\Phi_t - \alpha \nabla_{\Phi} f(\Phi, \mathbf{W}, \beta));$ 
4    $\mathbf{w}_{k,(t+1)} \leftarrow \text{eigvec}_{\lambda_{\max}}(\mathbf{B}_k^{-1} \mathbf{A}_k), \forall k = 1, \dots, K;$ 
5   if  $\|f(\Phi_{t+1}, \mathbf{W}_{t+1}, \beta) - f(\Phi_t, \mathbf{W}_t, \beta)\| < \epsilon$  then
6     break;
7   end
8    $t \leftarrow t + 1$ ;
9 end
10 Return  $\Phi \leftarrow \Phi_{t+1}, \mathbf{W} \leftarrow \mathbf{W}_{t+1}$ .

```

---

In Step 3,  $\Phi$  is updated based on the gradient. The gradient can be calculated as follows,

$$\nabla_{\Phi} f(\Phi, \mathbf{W}, \beta) = - \sum_{k=1}^K \frac{e^{-\beta z_k}}{\sum_{l=1, l \neq k}^K e^{-\beta z_l}} \nabla_{\Phi} z_k, \quad (4)$$

where

$$\nabla_{\Phi} z_k = c_{1k} \cdot \frac{L_k}{(\sum_{i=1, i \neq k}^K \rho_i |\mathbf{w}_k^H (\mathbf{h}_i + \mathbf{G} \Phi \mathbf{f}_i)|^2 + \sigma_b^2)^2}, \quad (5)$$

$$L_k = \left( \sum_{i=1, i \neq k}^K \rho_i |\mathbf{w}_k^H (\mathbf{h}_i + \mathbf{G} \Phi \mathbf{f}_i)|^2 + \sigma_b^2 \right) (2 \mathbf{w}_k^H (\mathbf{h}_k + \mathbf{G} \Phi \mathbf{f}_k) (\mathbf{G} \text{diag}(\mathbf{f}_k))^H \mathbf{w}_k) \quad (6)$$

$$- |\mathbf{w}_k^H (\mathbf{h}_k + \mathbf{G} \Phi \mathbf{f}_k)|^2 (2 \sum_{i=1, i \neq k}^K \rho_i \mathbf{w}_k^H (\mathbf{h}_i + \mathbf{G} \Phi \mathbf{f}_i) (\mathbf{G} \text{diag}(\mathbf{f}_i))^H \mathbf{w}_k), \quad (7)$$

$c_{1k}$  is defined in Eq. (16) of the paper, and  $\text{Proj}_{\Phi}(\Phi)$  is a projection operation as follows,

$$\Phi_{i,i} = \frac{\Phi_{i,i}}{|\Phi_{i,i}|}. \quad (8)$$

In Step 4,  $\mathbf{w}_k$  is effectively updated based on the generalized Rayleigh quotient, which has the closed-form expression in Eq. (22) of the paper.

The numerical simulation results are shown in Fig. 1. Notice that the AO scheme based on the smoothing technique and FISTA algorithm (AO-Grad) has the lowest performance compared to the proposed AO and MSB schemes.

Fig. 1: Performance comparison of methods with an increasing number of IRS elements.

Here, we provide a simple analysis of why AO-Grad exhibits lower performance. Consider the smoothed objective function  $f(\Phi, \mathbf{W}, \beta) = \frac{1}{\beta} \log \left( \sum_{k=1}^K e^{-\beta z_k} \right)$ , where  $z_k$  is defined as

$$z_k = c_{1k} \left( \frac{|\mathbf{w}_k^H (\mathbf{h}_k + \mathbf{G} \Phi \mathbf{f}_k)|^2}{\sum_{i=1, i \neq k}^K \rho_i |\mathbf{w}_k^H (\mathbf{h}_i + \mathbf{G} \Phi \mathbf{f}_i)|^2 + \sigma_b^2} \right) + c_{2k}. \quad (9)$$

The variable  $\Phi$  affects both the numerator and denominator in Eq. (9), resulting in a non-convex fractional programming problem. Although  $f(\Phi, \mathbf{W}, \beta)$  is a differentiable function, gradient descent-based algorithms (e.g., FISTA) is not appropriate to find the optimal result straightforwardly because  $f(\Phi, \mathbf{W}, \beta)$  remains non-convex.

In conclusion, we adopt the AO scheme based on the SDR and the generalized Dinkelbach's algorithm after carefully considering both security performance and support for the subsequent DL schemes.
